

FG007

FlowerGuard

**„Water in time..
..I'll tell you when!“**

Audio signal lets
you know when
your plant needs
watering.

Sensitivity level is
optional for all kinds
of plants.

FlowerGuard

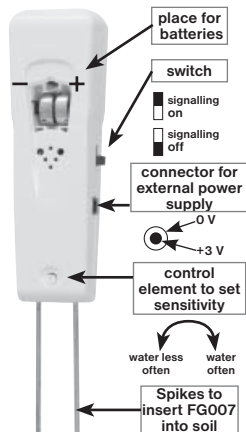

FG007

monitors soil humidity by conductivity measurements. When humidity of soil falls below the set limit FG007's alarm goes off to let you know that it is time to water a plant. FG007 reminds you to water the a plant every hour for about 30 second and stops the alarm when the level of moistness goes back to a set limit.

FG007 will not interrupt your sleep during the night. Thanks to light sensors it will wait till a sunrise starting the alarm!

FG007 is set to fit the needs of all kinds of common flowers. FG007's sensitivity to moisture can be adjusted in case your flower has special needs. When FG007 is switched on it measures the moistness every 10seconds, for the first 5 min., to enable to set FG007 properly (see below). After that the humidity measuring takes place every 20 min.

Sensitivity setting: Place the spikes of a FG007 into an optimally moist flowerpot. Use small screwdriver to turn the potentiometer into an utmost right position. Move the switch to an upper position and wait for the signal. Turn the potentiometer slowly to the left until the FG007 stops signalling. Setting is finished.

Lifespan of battery is approximately 1 year (depends on how often and for how long FG007 must signal). Power supply is also possible from a stable adapter 3V DC/100mA.

In case of doing so you need to take out the battery!

Not following these instructions may damage your FG007!

FG007 is powered by 2x1.5V alkal. battery, type LR44. Protection IP20.

While watering a plant the FG007 must be protected against water drops!

FG007's plastic cover must not get in contact with water!

FG007 must be used in accordance with a company's manual otherwise the producer is not responsible for damage!
